

Supplemental Data Figure 2: Average change in MAP from baseline over three-minute hand cold pressor test for **A)** controls and **B)** individuals with SCI. Perturbations in these responses are represented per frequency of sub-motor threshold spinal cord stimulation. Solid gray line represents completion of cold pressor test with subsequent 60 seconds of recovery. **C-F)** For each spinal cord stimulation frequency and cohort, change in MAP area under the curve (**C**), change in R-R interval area under the curve (**D**), change in lower extremity vascular resistance (**E**), and change in foot galvanic skin response (**F**).

MAP= mean arterial pressure; GSR= galvanic skin response; SCI= spinal cord injury; R-R interval in seconds, PRU= peripheral resistance unit
